DataGuard® Category, Bus & Coax Cables

DataGuard® cables are the industrial version of our high-performance copper & fibre network and Industry 4.0 communication cables. These cables incorporate various armour types according to application. These cables are protected by a layer of steel in the form of galvanised wire applied to the cable typically with an enhanced performance outer sheath for further protection.

For onshore applications in fixed installations industrial protection is provided by round steel wire armour. For offshore, marine, flexible & high vibration installations galvanised steel wire or tinned copper wire braid is applied with special applications of interlocking galvanised steel wire tape or overlapping steel tapes used for flexibility and/or rodent and termite protection.
